                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
```

The invention relates to a fusion protein comprising non-heparin binding vascular endothelial growth factor (VEGF) peptide portion and a non-VEGF peptide portion and seful for promoting angiogenesis and/or bone growth in mammalian host. The fusion protein is useful for promoting angiogenesis,

```
CC wound healing and bone growth. Compositions containing bone growth
CC promoting fusion protein can be used to treat osteoporosis, rheumatoid
CC or osteoarthritis, to improve poor bone healing, to promote implant
CC integration and function of artificial joints and to facilitate bone
CC reconstruction. They can also be used to treat e.g. ulcers, lesions,
CC injuries, burns, trauma, periodontal conditions, lacerations and other
CC conditions. The invention is also useful in protein therapy. The present
CX sequence is human VEGF121 protein.

GENERAL INFORMATION

```
PATENT NO. 5219739

PATENT NO. 5219739

APPLICANT: TISCHER, EDMUND G.; ABRAHAM, JUDITH A.; FIDDES, JOHN C.; MITCHELL, RICHARD L.

TITLE OF INVENTION: DNA SEQUENCES ENCODING BYEGF120 AND HUMEN FOR THE PRODUCTION OF BOVINE AND HUMAN VAASCULAR ENDOTHELIAL CELL GROWTH FACTORS, BYEGF120 AND HYEGF121

VAASCULAR ENDOTHELIAL CELL GROWTH FACTORS, BYEGF120 AND HYEGF121

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/07/559,041

FILING DATE: 27-JUL-1990

PRIOR APPLICATION DATA:
                                                                                                                                                                                                                                                 RESULT 11

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                Score

Cell 112:379-389(2003).

-i- FUNCTION: Essential regulator of plant defense, which plays a central role in resistance in case of infection by a pathogen. It is a common target for both type III avirulence proteins from Pseudomonas syringae (AvrB, AvrRpm1 and AvrRpt2) and for the plant Resistance (R) proteins RPM1 and RPS2. In strains carrying the appropriate R gene for avirulence proteins of the pathogen, its association with avirulence proteins triggers a defense system including the hypersensitive response, which limits the spread of disease. In contrast, in plants lacking appropriate R genes, its association with avirulence proteins of the pathogen impairs the defense system and leads to the pathogen multiplication.

-I- SUBUNIT: Interacts with the unrelated avirulence proteins AvrB, AvrRpm1 and AvrRpt2 from Pseudomonas syringae. Interacts with the association with AvrB and AvrRpm1 results in its phosphorylation, which is in turn recognized by the resistance RPM1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RIN4 OR AISGZDOVY ON TOTAL RING OF AISGZDOVY ON

THE CHANNEL ACTIVITY IS DIRECTED BY THE PORE-FORMING AND VOLTAGE-SENSITIVE ALPHA-1 SUBUNIT. IN MANY CASES, THIS SUBUNIT IS SUFFICIENT TO GENERATE VOLTAGE-SENSITIVE CALCIUM CHANNEL ACTIVITY. THE AUXILIARY SUBUNITS BETA AND ALPHA-2/DELTA LINKED BY A DISULFIDE BRIDGE REGULATE THE CHANNEL ACTIVITY (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: EACH OF THE FOUR INTERNAL REPEATS CONTAINS FIVE HYDROPHOBIC TRANSMEMBRANE SEGMENTS ($1, $2, $3, $5, $6) AND ONE POSITIVELY CHARGED TRANSMEMBRANE SEGMENT ($4). $4 SEGMENTS POSITIVELY CHARGED THE VOLTAGE-SENSOR AND ARE CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: STRUCTURAL COMPONENT OF CONNECTIVE TISSUE MICROFIBRILS THAT BINDS CALCIUM. FIBRILLIN-2-CONTAINING MICROFIBRILS REGULATE THE EARLY PROCESS OF ELASTIC FIBER ASSEMBLY.

DISEASE: DEFECTS IN FBN2 ARE THE CAUSE OF CONGENITAL CONTRACTURAL ARACINODACTYLY (CCA) (ALSO KNOWN AS BEALS SYNDROWE). CCA IS PHENOTYPICALLY SIMILAR TO MARFAN SYNDROME, BUT DOES NOT EFFECT THE AORTA AND THE EYES.

SIMILARITY: Contains 47 EGF-like domains.

SIMILARITY: Contains 7 TGF-beta binding protein (TGFBP) domains.

It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and

CERTITISSUE Res. 296:339-349(1999).

-I-FUNCTION: Growth factor active in angiogenesis, vasculogenesis a endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFRZ/Kdr receptors and to heparan sulfate and

It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and
